1. Server-Side JavaScript Injection (SSJI)
2. Solution

Server-Side JavaScript Injection (SSJI)

Server-Side JavaScript Injection is a vulnerability where untrusted user input is executed as JavaScript code on the server.

Why SSJI happens?

1. Untrusetd user input
2. No proper input validation and sanitization
3. eval() and Funtion()
4. No proper security auditing

Solution

- Proper input validation and Sanitization
- Never use eval() and Function()
- Parse user input
- Do security auditing in your application

setTimeout
setInterval

Don't use this synatx - Lagecy browser will run this code but node js block this code

setInterval("console.log('Hi')", 1000)

Good Synatx:

```
setInterval(() => {
  console.log("Hi")
}, 1000)
```

LoopKaka
