

1. Server-Side Request Forgery (SSRF)

2. Solution

Server-Side Request Forgery (SSRF)

Server-Side Request Forgery (SSRF) is a security vulnerability where an attacker tricks a server into making HTTP requests to unintended websites or internal systems on the attacker's behalf.

1. Internal endpoint

2. Cloud metadata - AWS, GCP, Azure

Why it happens?

1. No proper input validation
2. Server blindly trust any URL from user
3. Server makes HTTP request on behalf of user
4. Insufficient access control
5. No proper whitelisting

Solution

- Validate Input
- Domain whitelist - [" picsum.photos/"]
- Block internal ips
- DNS Resolution
- Validate Protocols
 - Allow - HTTPS
 - Block - FTP, File etc
