

1. Project Structure
2. Input Validation
3. Types of validation
4. Whitelist
5. Blacklist

Input Validation

Input Validation is the process of checking whether user input is valid, expected, and safe before processing it.

Input

```
<script>
alert("hack")
</script>
```

DROP table

SELECT *

RULE: Never trust user input

Types of validation

1. Client-side validation
2. Server-side validation

Client-side validation

Validation performed inside the browser before sending data to the server.

Advantages:

1. Good user experience
2. Fast
3. Less network traffic

Problem:

1. User can bypass client side validation

It improves user experience but it doesn't provide proper security

Server-side validation

Validation performed on the server after receiving the request.

In server side we can have the proper validation

Whitelist

Accept only known good values.

Country: India, USA, Nepal

Age: age > 0 and age < 100

Blacklist

Reject known bad values.

```
<script>
DROP table
Select *
```
