

1. XSS Attack (Cross-Site Scripting Attack)
2. Stored XSS
3. Reflected XSS
4. DOM XSS
5. Solution

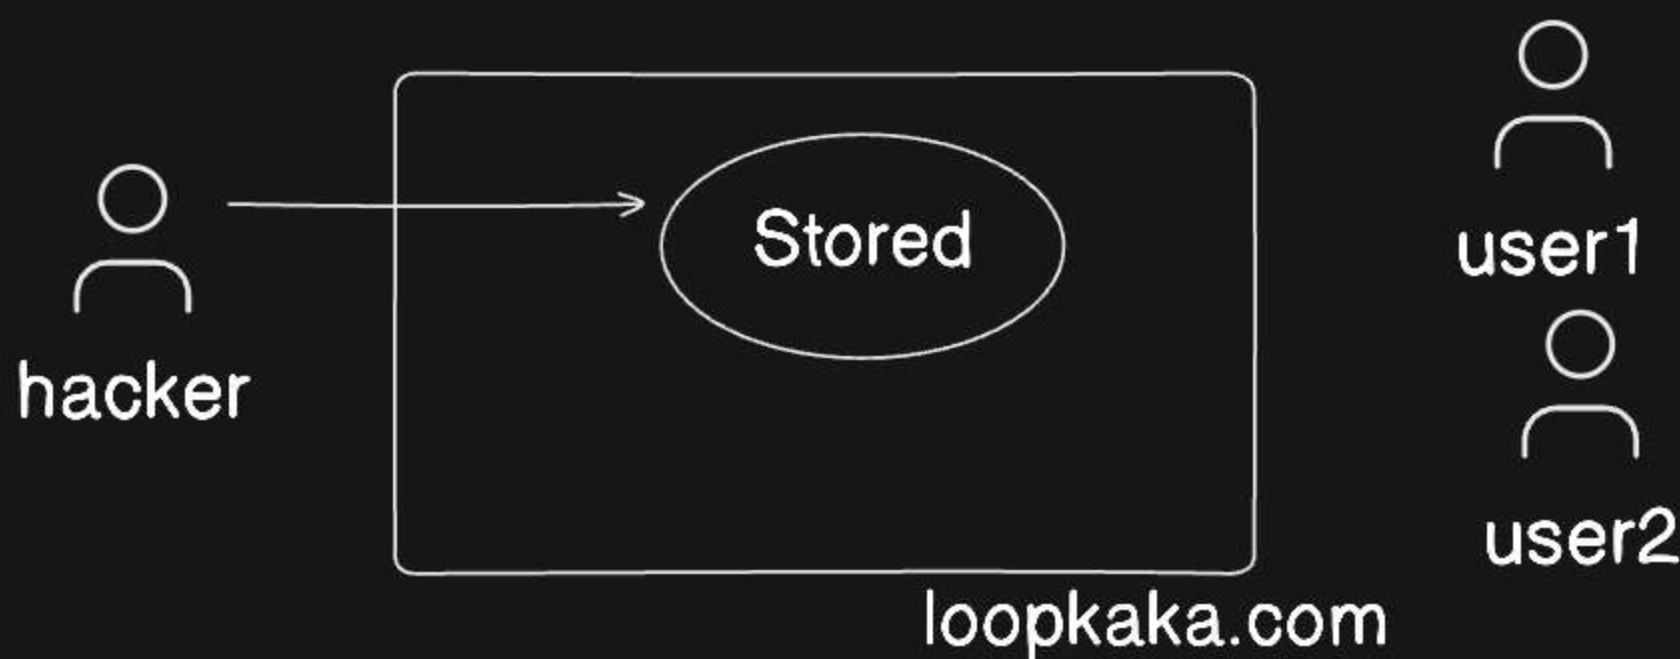

XSS Attack (Cross-Site Scripting Attack)

Cross-Site Scripting is a vulnerability where an attacker injects malicious JavaScript into a trusted website, causing another user's browser to execute that code.

Stored XSS Attack

Stored XSS occurs when malicious input is stored on the server and later executed in other user's browsers.

Reflected XSS

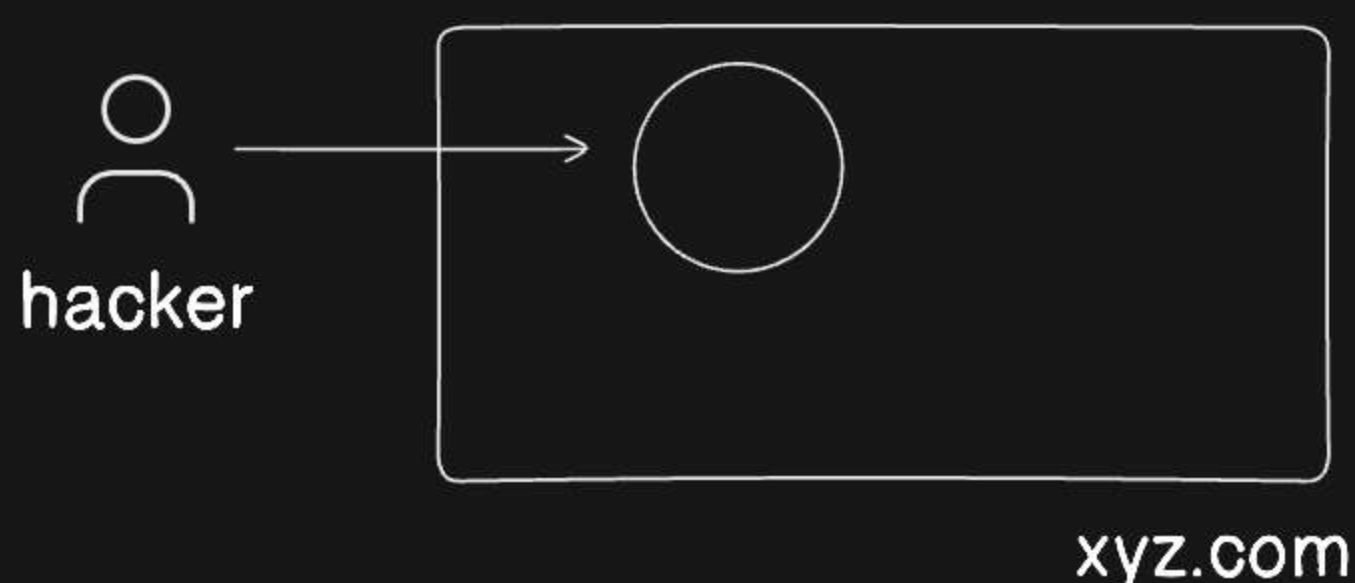

Reflected XSS is an attack where user input is reflected in the server's response without proper escaping or sanitization, allowing malicious JavaScript to execute in the browser.

```

```

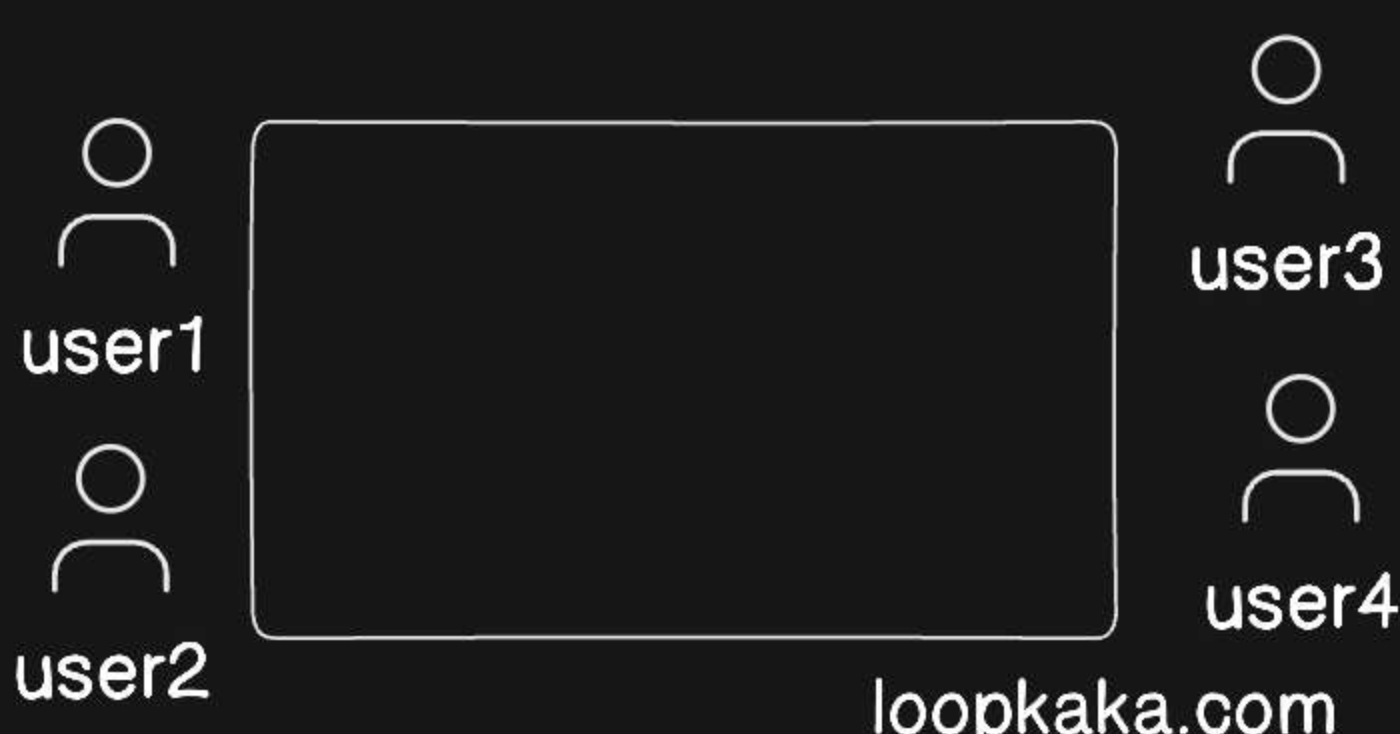

DOM XSS

DOM XSS is an XSS attack where untrusted data is written into the DOM by client-side JavaScript in an unsafe way, leading to JavaScript execution in the browser.

```

```

If you don't handle XSS attack properly then your business may impact heavily

Solution

- Escaping
- Encoding
- HTML Sanitization
- CSP headers
